

In DG

Supplemental Table 4 – Statistical results of Kruskal-Wallis H-tests and paired Mann-Whitney U-tests performed on Western Blot results for the DG area. Values of H and p (Kruskal-Wallis) are indicated for each protein of interest (below the protein's name). Values of U and p (Mann-Whitney) are expressed for each paired statistical analysis performed between the results of one group (i.e. RM) and another (i.e. HIWM) for each protein of interest. U and p values found significant after H-tests and Holm's correction are highlighted in dark grey. U and p values found significant after H-tests, but found non-significant after Holm's correction are indicated in grey. U and p values with p < 0.05 but from non-significant H-test are indicated in light-grey.
